Amendments to the Claims:

1 – 10 (canceled)

11. (previously presented) An open-cooled blade for a gas turbine, comprising:

a root portion; and

an airfoil portion, wherein the airfoil portion comprises:

an outer wall exposed to a hot gas,

a first cavity partly defined by the outer wall and for a first medium,

a plurality of through-openings arranged in the outer wall where the through-openings open into the first cavity on a first side and into the hot-gas space on a second side, and

a second cavity for admixing a second medium, the second cavity being fluidically connected to the through-openings,

wherein the second cavity is formed by supply passages that are provided in the outer wall and are connected via transverse passages to the through-openings designed as through-bores, so that the two media cannot be mixed until inside the through-bores.

12. (previously presented) The blade as claimed in claim 11, wherein the outer wall has a multiplicity of through-bores, a multiplicity of supply passages running between the bores, and a multiplicity of further transverse passages linking the supply passages with the through-bores.

13. (currently amended) The blade as claimed in claim 11, wherein the outer wall has at least two layers which ~~can be~~are connected to one another.

14. (previously presented) The blade as claimed in claim 11, wherein the passages are incorporated between two layers in a layer surface.

15. (currently amended) The blade as claimed in claim 11, wherein the first cavity is connected to a first fluid source and the supply passages ~~can be~~are connected to a second fluid source.

16. (previously presented) The blade as claimed in claim 15, wherein one of the two fluid sources is an oxidation source and the other fluid source is a fuel source.

17. (canceled).

18. (cancelled)

19. (previously presented) A gas turbine, comprising:

a compressor section;

a turbine section;

a combustion chamber; and

a plurality of blades where each blade comprises:

an outer wall exposed to a hot gas,

a first cavity partly defined by the outer wall and for a first medium,

a plurality of through-openings arranged in the outer wall where the through-openings open into the first cavity on a first side and into the hot-gas space on a second side, and

a second cavity for admixing a second medium, the second cavity being fluidically connected to the through-openings,

wherein the second cavity is formed by supply passages provided in the outer wall and connected via transverse passages to the through-openings designed as through-bores, so that the two media cannot be mixed until inside the through-bores.
